Appendix 3 - CR4 Scenario

Long-term management of COPD with inhaled bronchodilator maintenance therapy. This scenario exposes the parameters for the Inhaled Salbutamol, Ipratropium Inhaler, and Oral Prednisolone interventions. This was the mapping for the CR4 Scenario in Appendix 3 simulations. Inhaled Salbutamol remains at baseline coverage for the first projection year and then increases to ninety-five percent coverage for the rest of the projection. Ipratropium Inhaler reduces the disability weight of persons living with COPD by 16.9%, providing long-acting bronchodilation for maintenance therapy. This intervention targets 21% of the COPD population who require ongoing bronchodilator therapy for symptom management and prevention of exacerbations. Ipratropium Inhaler remains at baseline coverage for the first projection year and then increases to ninety-five percent coverage for the rest of the projection. Oral Prednisolone remains at baseline coverage in the Appendix 3 CR4 scenario. This should typically be run as a comparison scenario, with the baseline scenario being the COPD Baseline, or modified versions with different target coverage levels for long-term COPD management strategies.

This is a manifest-level scenario card. If the scenario file contains a Country value, that value is the scenario authoring default; the run certificate records the countries actually materialised and executed. **Scenario Parameters**
